

# Difficult decisions: Intestinal Transplant

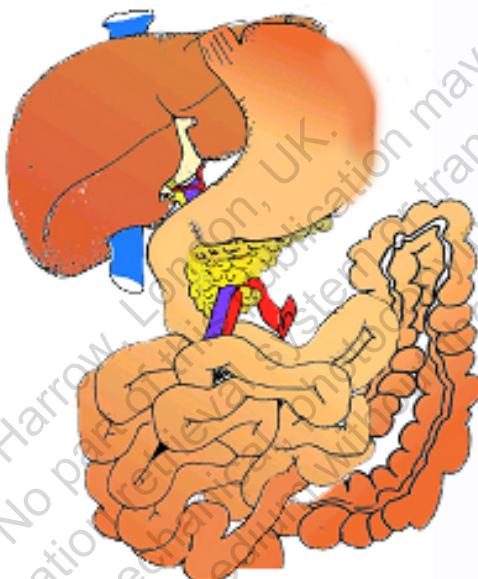

*Dr Lisa Sharkey, Consultant Physician  
Cambridge Intestinal and Multivisceral Transplant team*

# *Types of intestinal containing grafts*

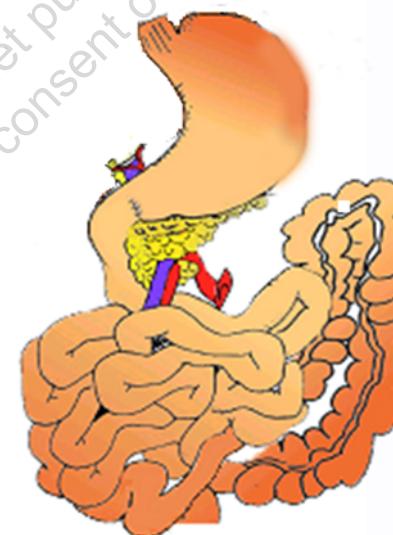

Intestine only (SB)

Multivisceral Transplant  
(MVT)

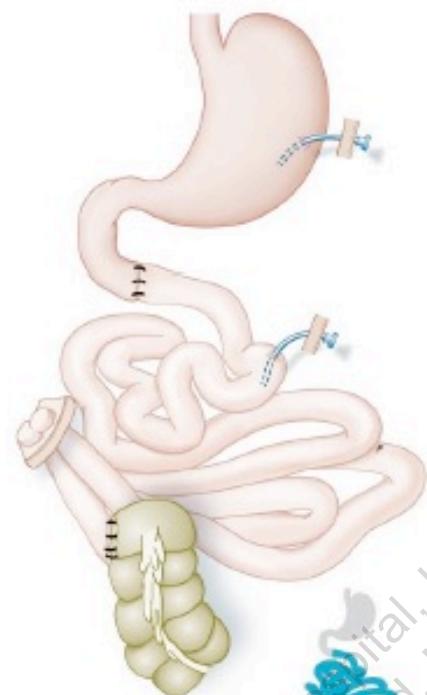

Modified Multivisceral  
Transplant (MMVT)

# Global number of ITx = 3414

**Adults / children: 49% / 51%**

**1964 - 2017.**

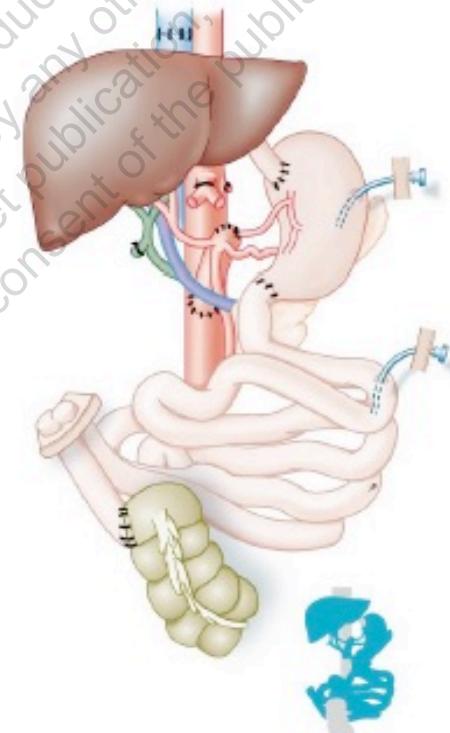

**Isolated  
Bowel**

**45%**

**Combined  
Liver + Bowel**

**31%**

**Multivisceral**

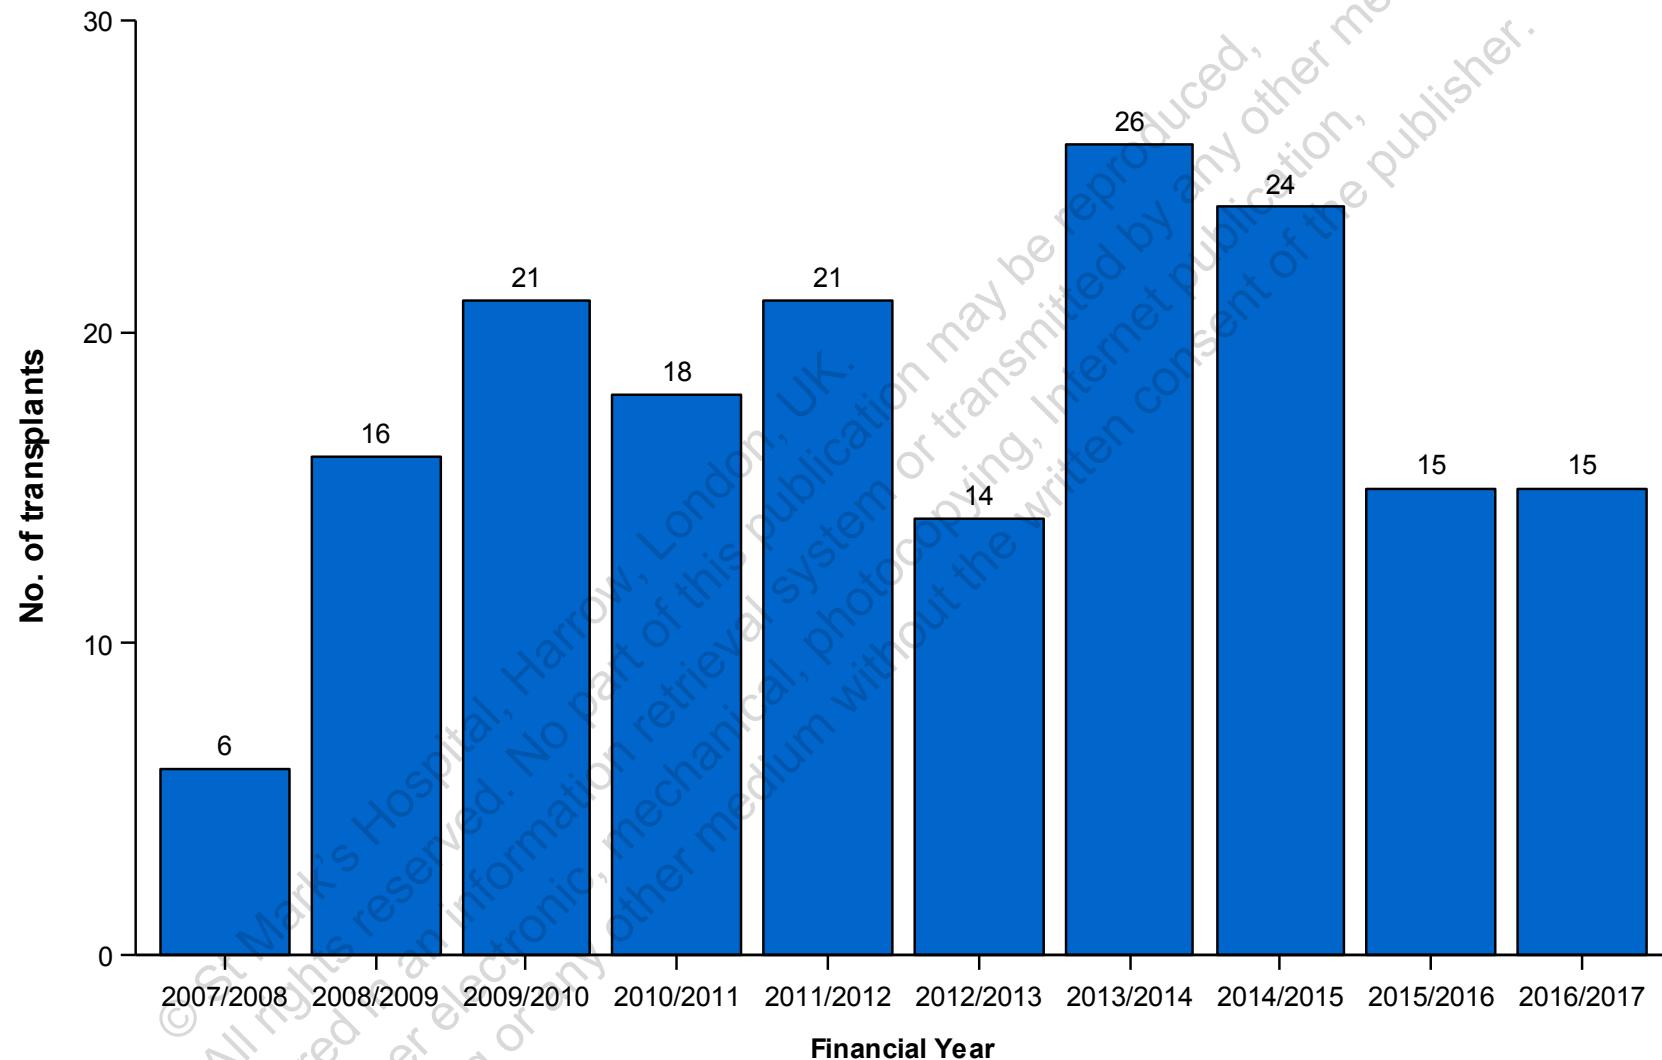

**24%**

# *UK Criteria for Intestinal Transplant*

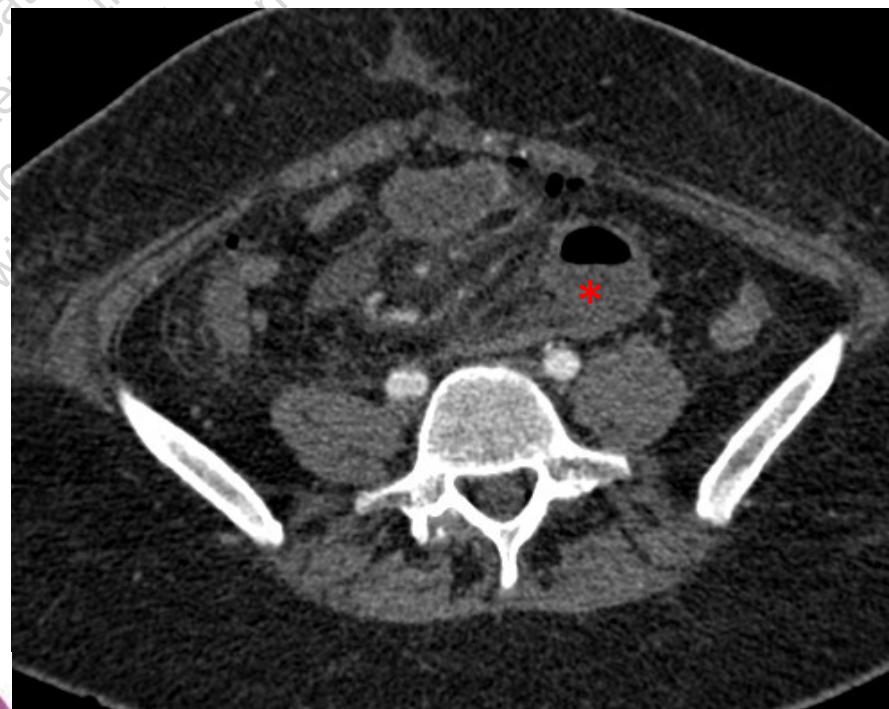

## *NHSBT Patient Selection Policy Sept 2015*

- 1. Irreversible Intestinal Failure, plus**
  - a. Progressive IFALD (Liver or non-liver containing graft depending on severity of disease)
  - b. Severe sepsis (>1 life-threatening CRBSI for which no remedial cause can be found, or endocarditis or other metastatic infection)
  - c. Limited central venous access (Venous access limited to 3 major conventional sites)
  - d. Very poor QoL thought to be correctable by transplantation
- 2. Need for extensive evisceration, considered untenable without associated transplant**
- 3. Requirement for transplantation of another organ where exclusion of simultaneous intestinal transplant would adversely affect survival**

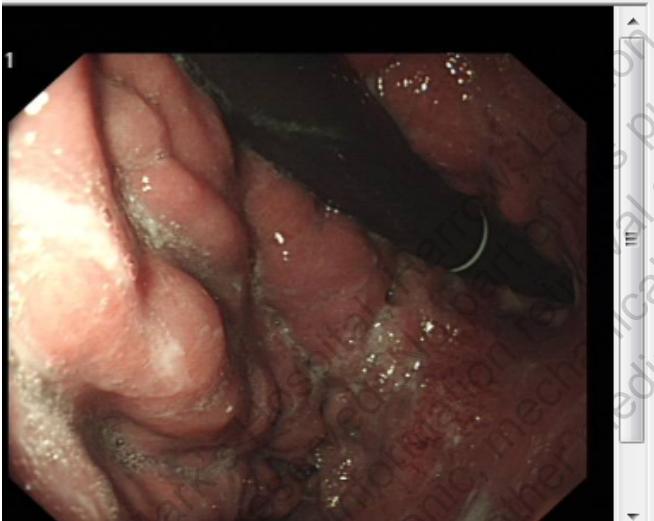

## *Emerging Indications*

Widespread splanchnic ischaemia  
(simultaneous or sequential occlusion of  
Coeliac Axis and SMA)

## ***Emerging Indications***

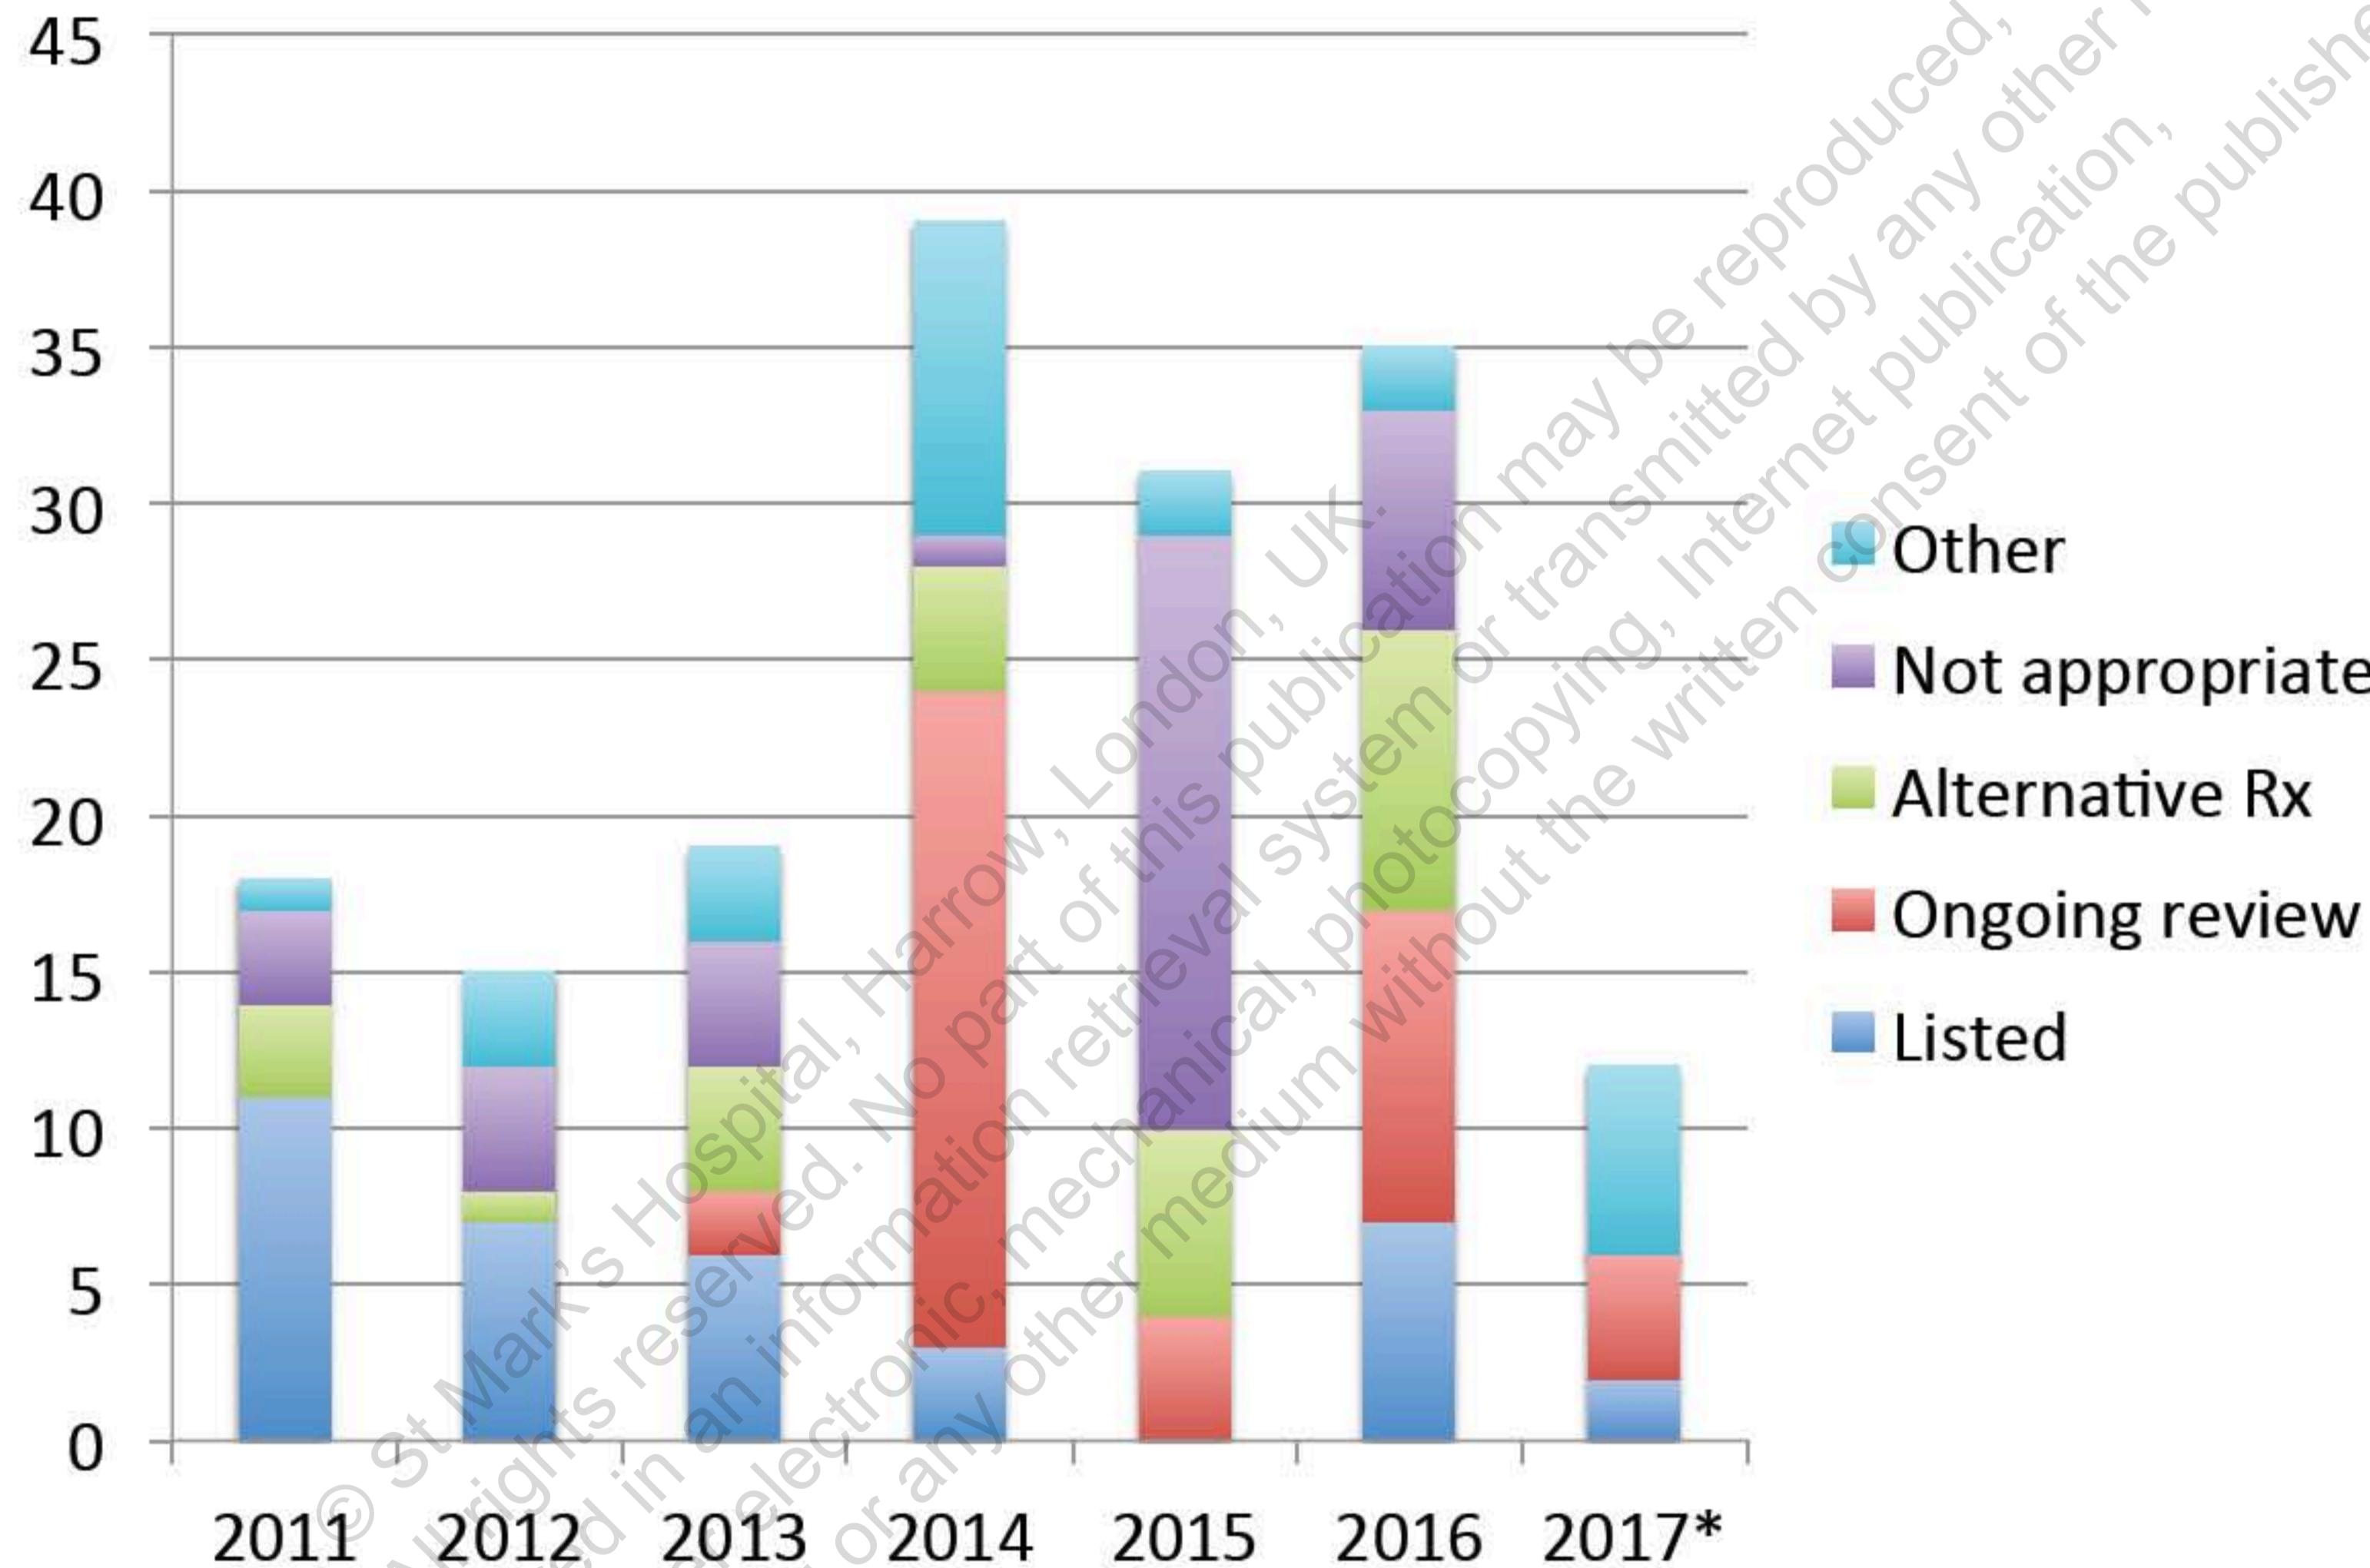

Non Cirrhotic Portal Hypertension with recurrent Life-threatening bleeding

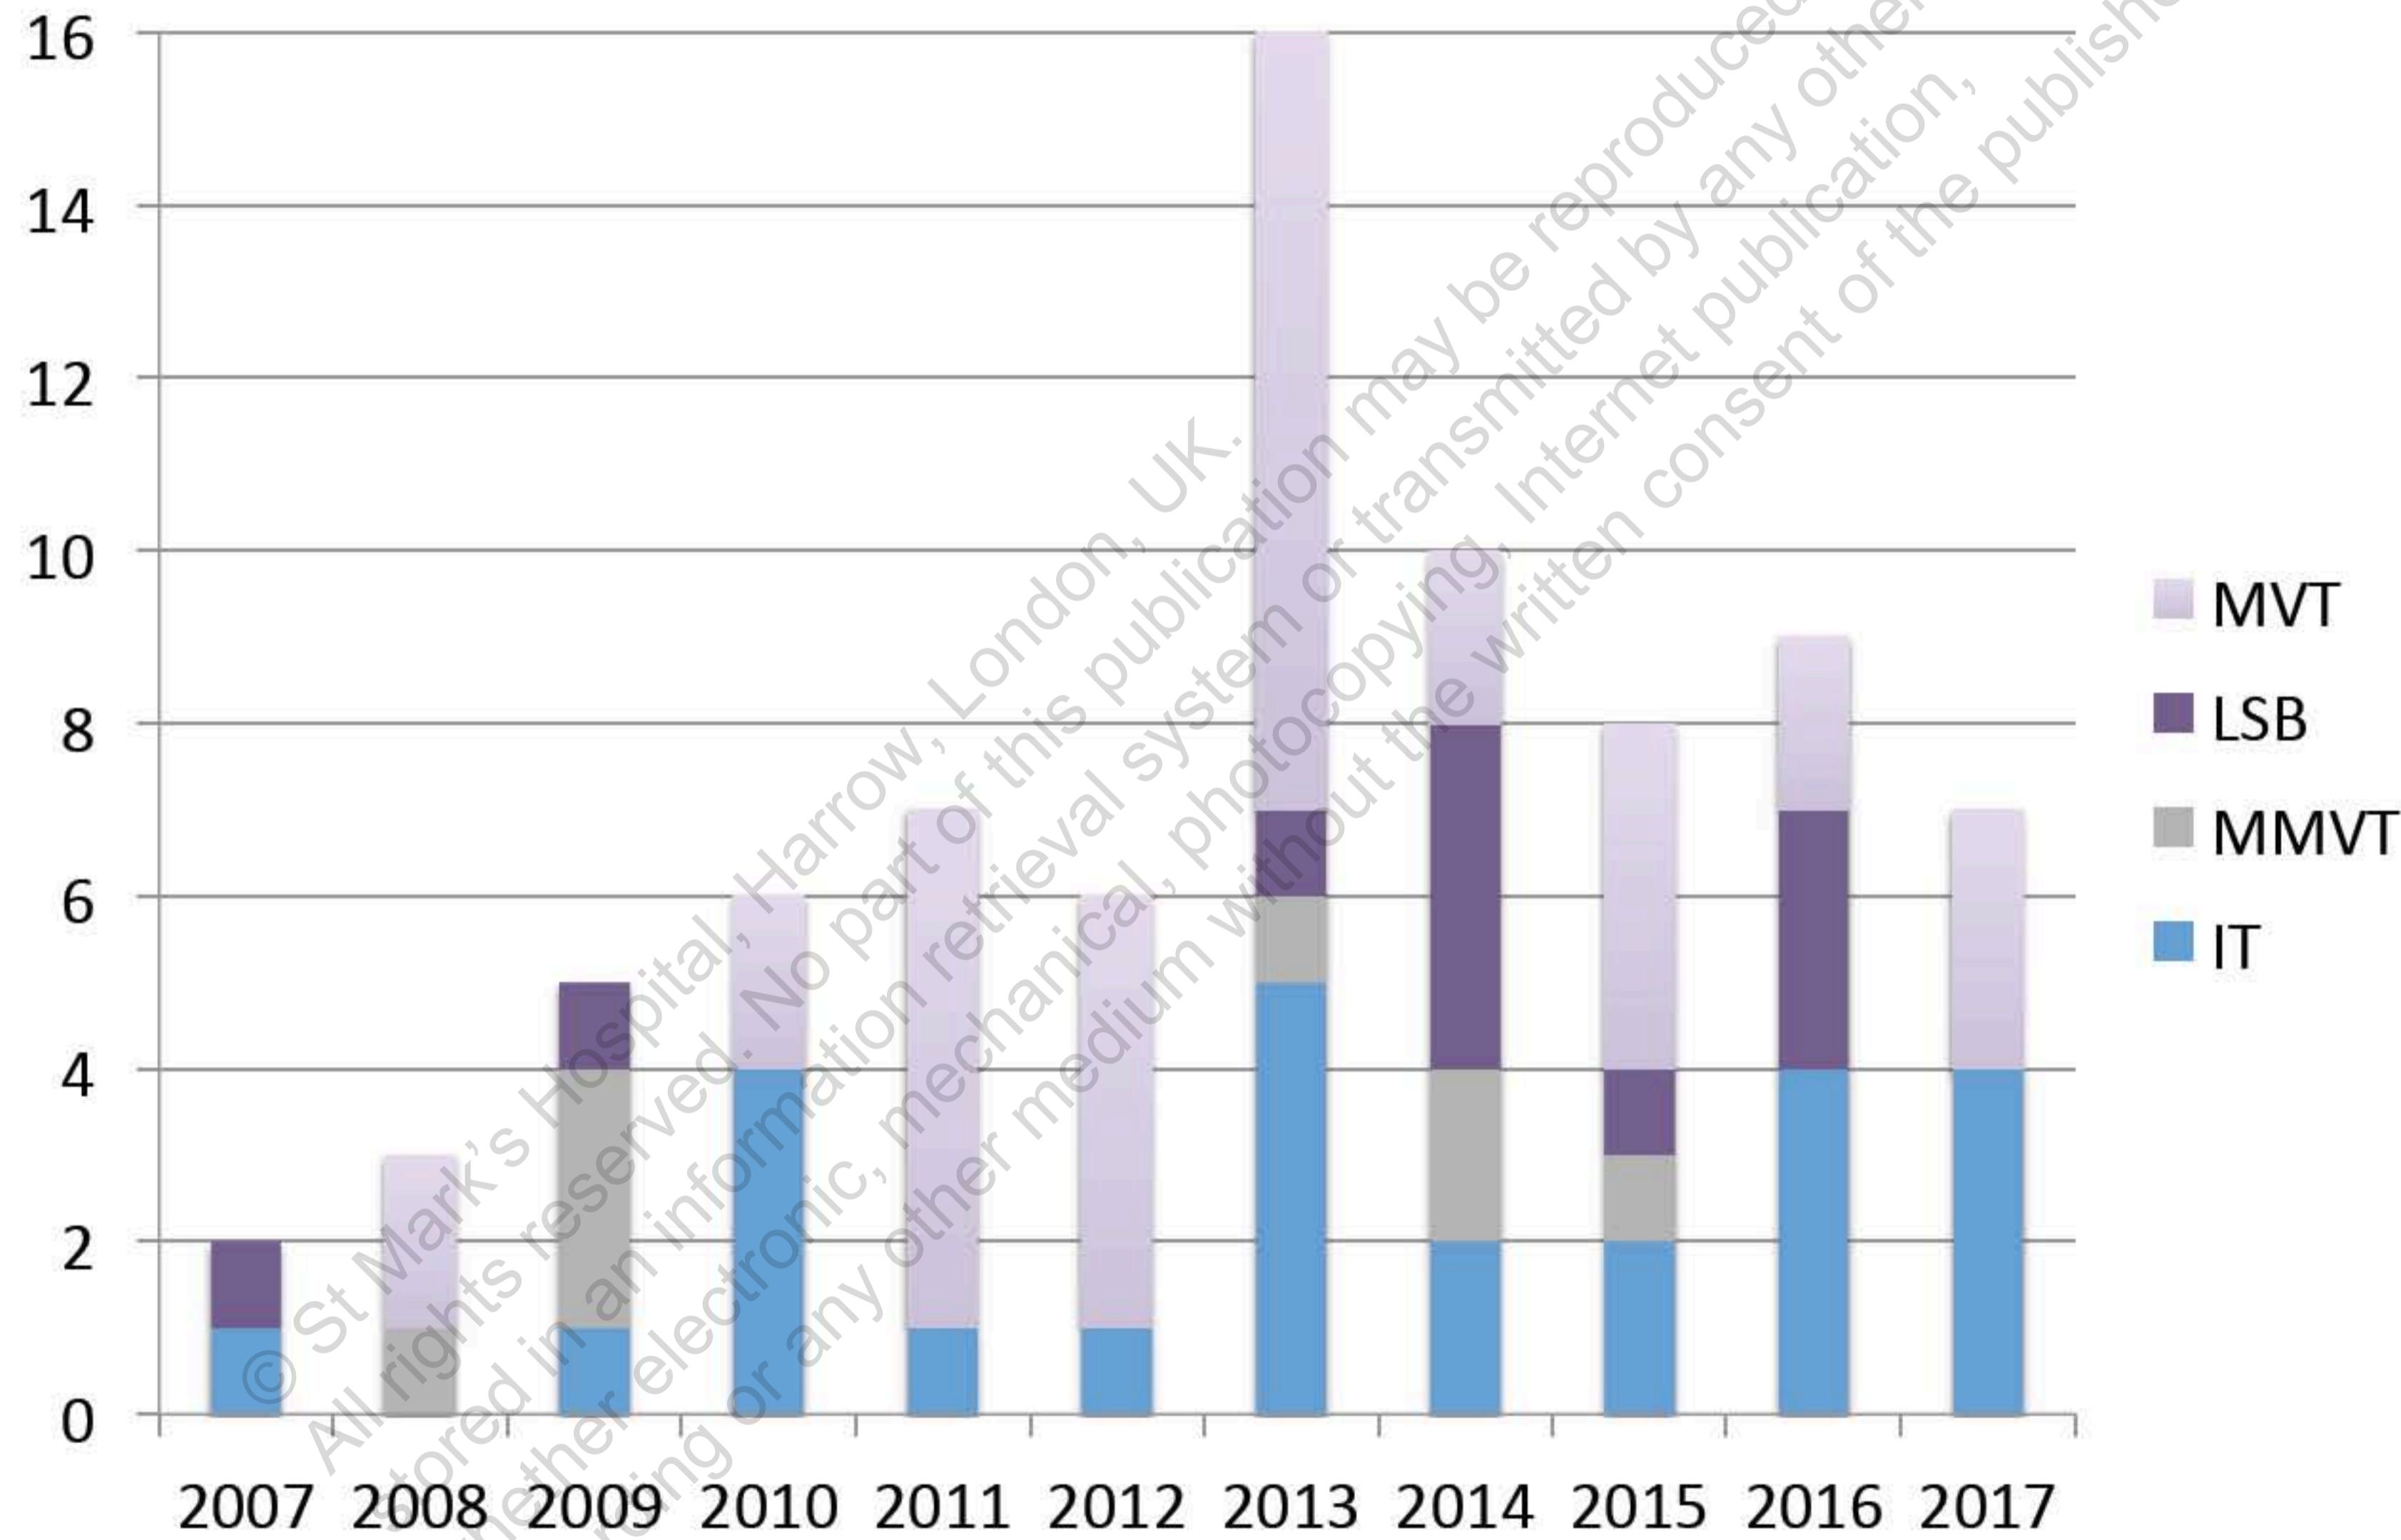

- All other options exhausted first (TIPSS, surgical shunt, splenectomy, gastric devascularisation)

Patients requiring a Whipple's procedure with concurrent extensive portomesenteric venous thrombosis

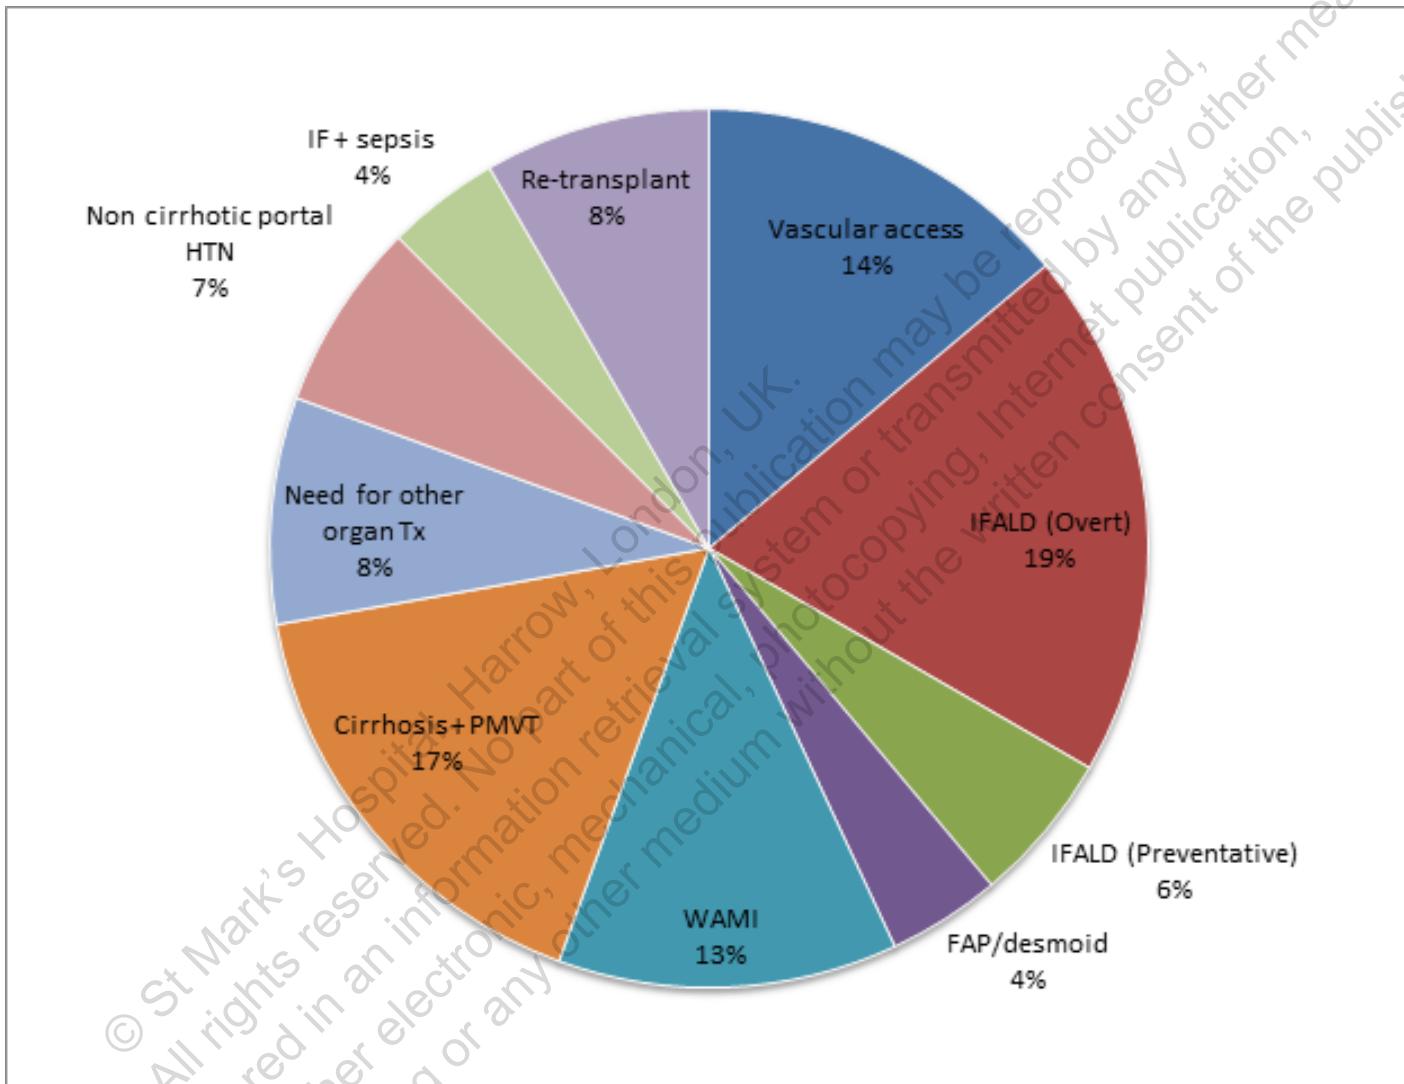

# Outcome of referrals

# Numbers transplanted by year

# Indications at CUH 2007-2017

# Standard assessment pathway

- Preliminary Discussion:
- Adequacy of imaging
- Discussion of options
- Agreement on investigations
- Invite for assessment

## 2 week assessment:

- Cardiovascular
- Respiratory
- Radiology
- Anaesthetic review
- Hepatology
- Nutrition
- Psychiatry
- Haematology
- Pathology
- Chronic pain
- Extensive discussions re consent

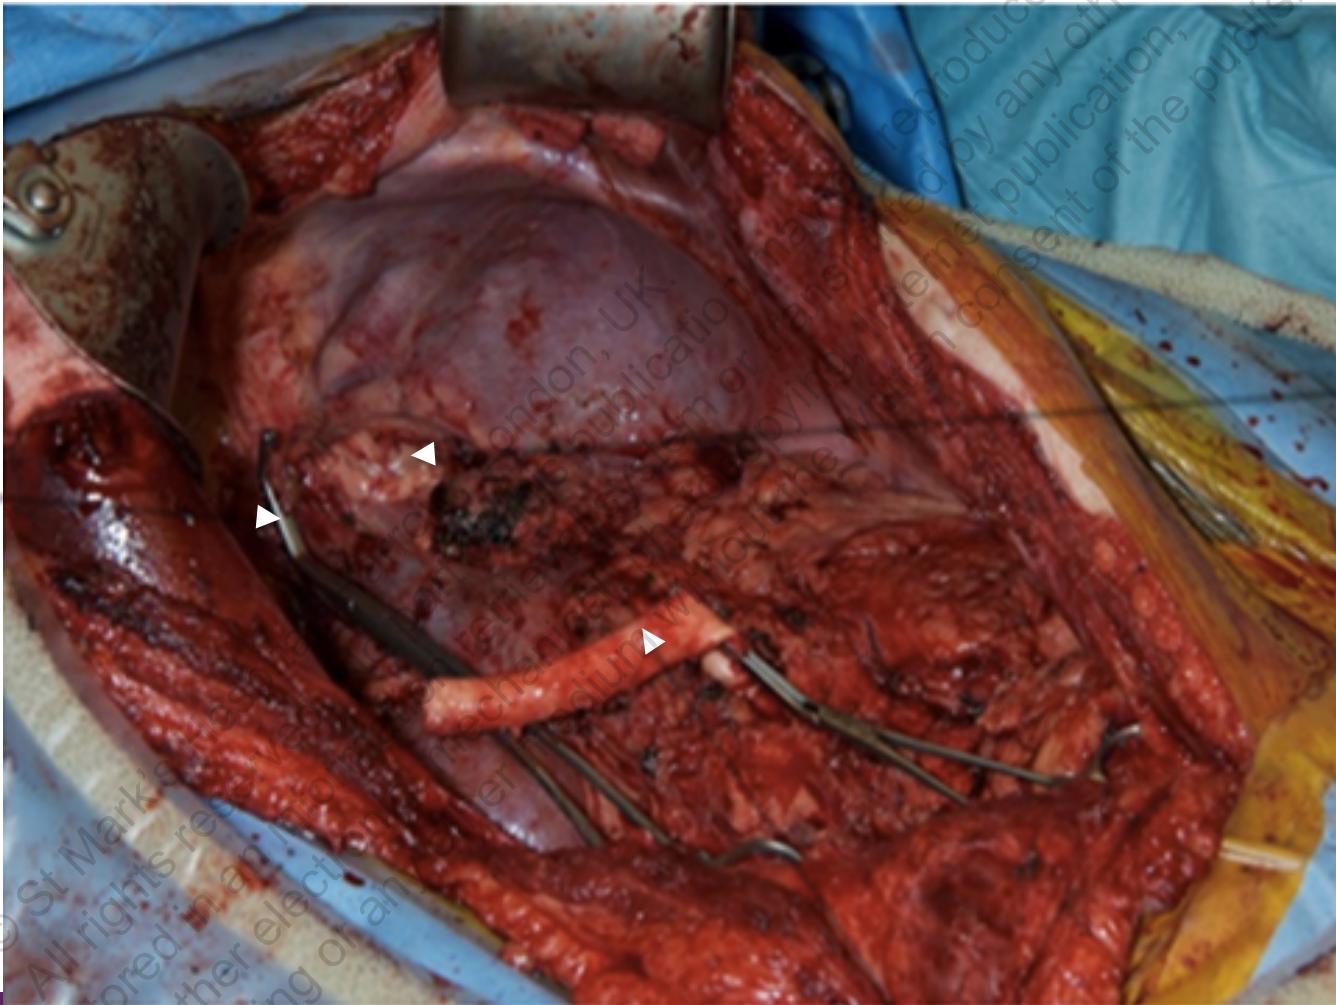

- Discussion at local MDT:
  - Multi-visceral
  - Liver
  - Renal

NASIT

Listing

# The Transplant: Eviscerated abdomen

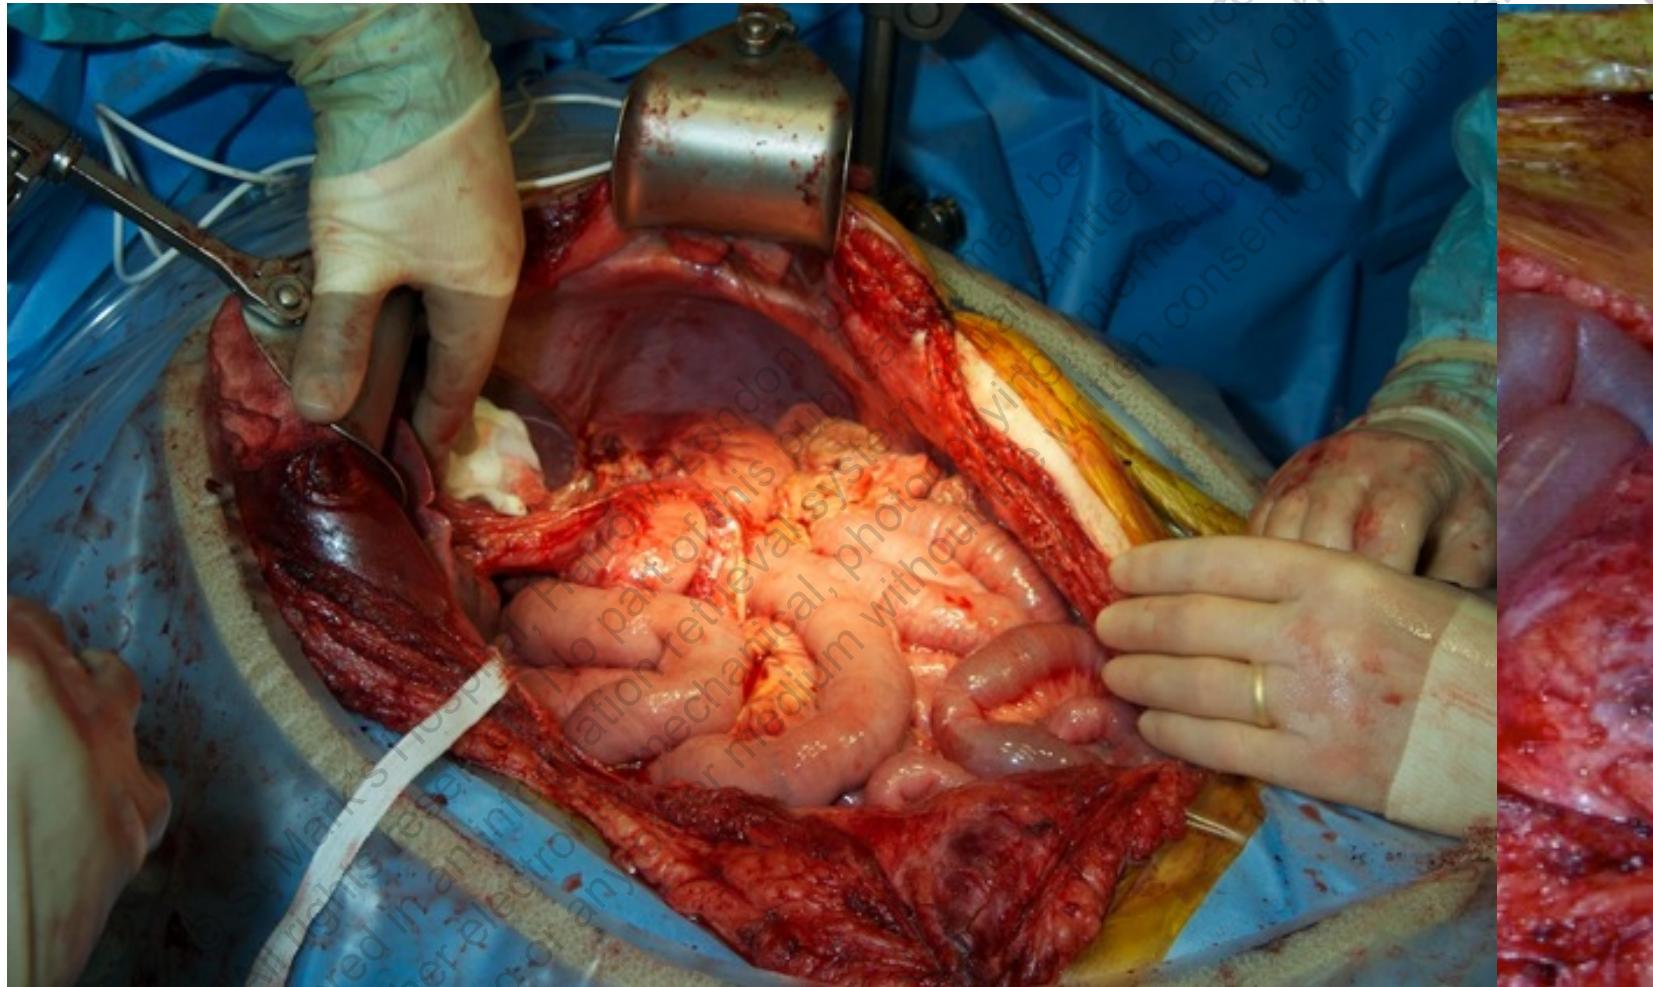

Clamp on  
Hepatic veins

Stapled off  
oesophagus

Arterial Conduit (donor thoracic aorta)

# *Reperfusion*

# *Surgical problems*

# Immunosuppression

- Induction
  - Lymphocyte depletion (Campath / Alemtuzumab, anti-CD52) 1-2 doses
  - + Methylprednisolone 500mg
- Maintenance
  - Tacrolimus (trough level 8-12)
  - Methylprednisolone 20mg BD for first week, then taper
  - Antimetabolite from 4 weeks
- Antibiotic/Antifungal/CMV and PCP prophylaxis

# *Post-Transplant Complications*

Not unique to Intestinal or MVT but higher rates?

- Acute cellular rejection
- Atypical (and typical!) infections
- Graft-versus-host-disease
- Coagulopathy +/- thrombotic tendencies
- Drug-induced leucopenia
- Posterior Reversible Encephalopathy Syndrome
- Post-transplant TTP
- Renal Failure
- CMV
- Encephalopathy – iatrogenic Portosystemic shunt, encephalopathy of acute rejection

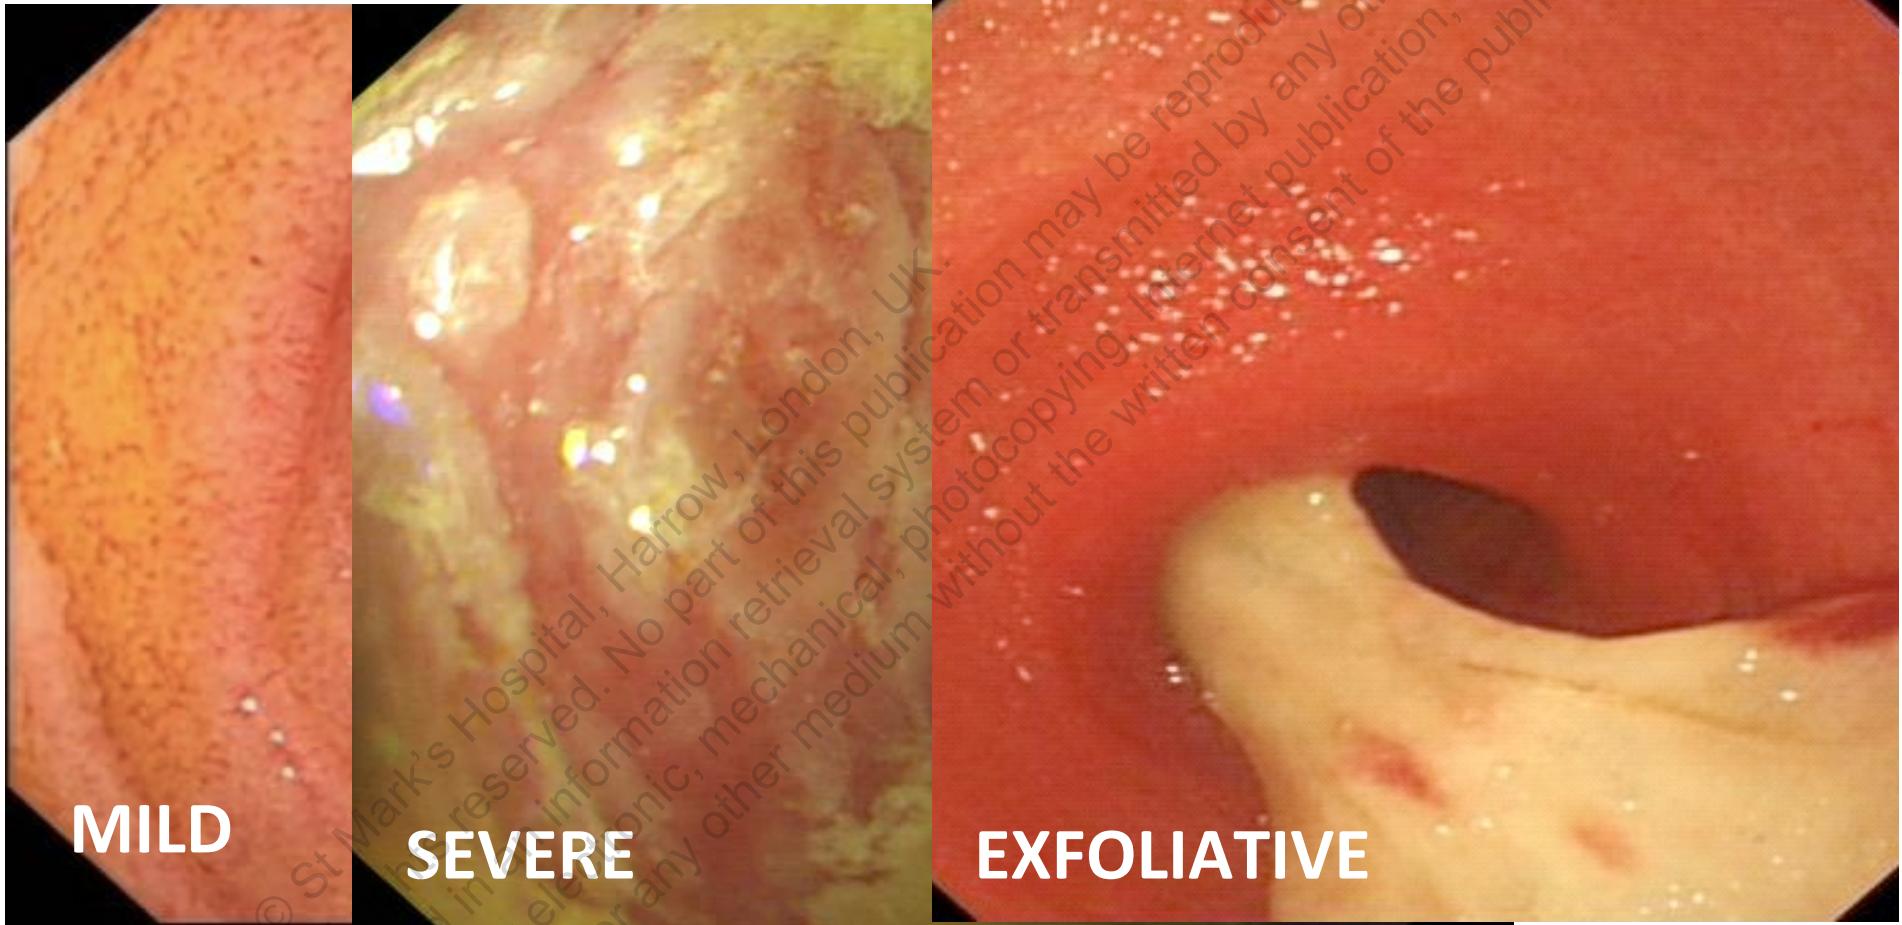

# *Post-Transplant Complications*

- **Acute cellular rejection**
- **Atypical (and typical!) infections**
- **Graft-versus-host-disease**
- Coagulopathy +/- thrombotic tendencies
- Drug-induced leucopenia
- Posterior Reversible Encephalopathy Syndrome
- Post-transplant TTP
- **Renal Failure**
- **CMV**
- Encephalopathy—iatrogenic Portosystemic shunt, encephalopathy of acute rejection

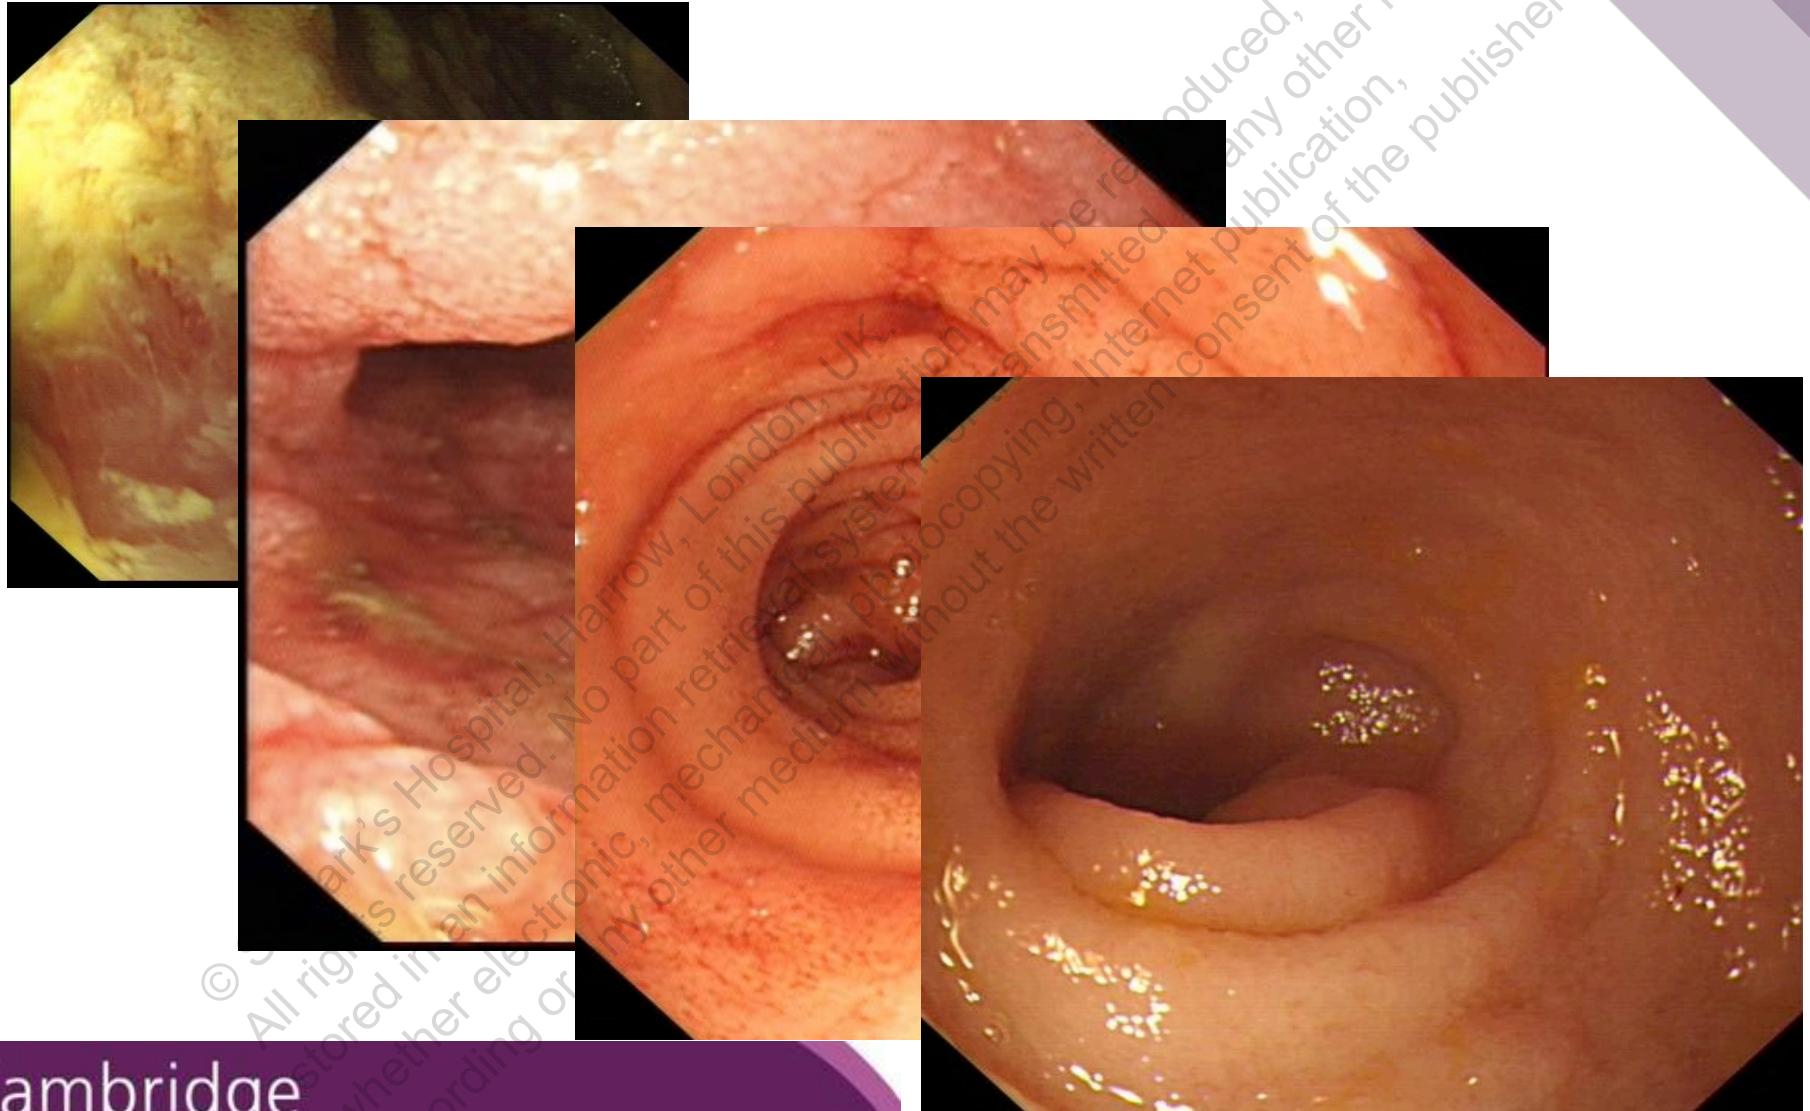

# Graft Rejection

- 30-40% our patients experience an episode of acute cellular rejection (ACR) in the first year
- Presentation:
  - Asymptomatic
  - High output stoma, abdominal pain, fever
  - Severe sepsis (secondary to translocation)
- Diagnosis:
  - Graft endoscopy & biopsy – epithelial apoptosis
  - CT, US
  - Biomarkers?

# *Endoscopic appearances of rejection*

# Recovery from rejection

# Graft versus Host Disease

- 10% incidence post ITx
- Presentation
  - Rash (biopsy-interface dermatitis, FISH)
  - Other sites – native GI tract, liver, lungs, eyes, kidney, bone marrow
  - Peripheral T cell chimerism
- Management options
  - Increase immunosuppression
  - Decrease/stop immunosuppression
  - Novel therapies

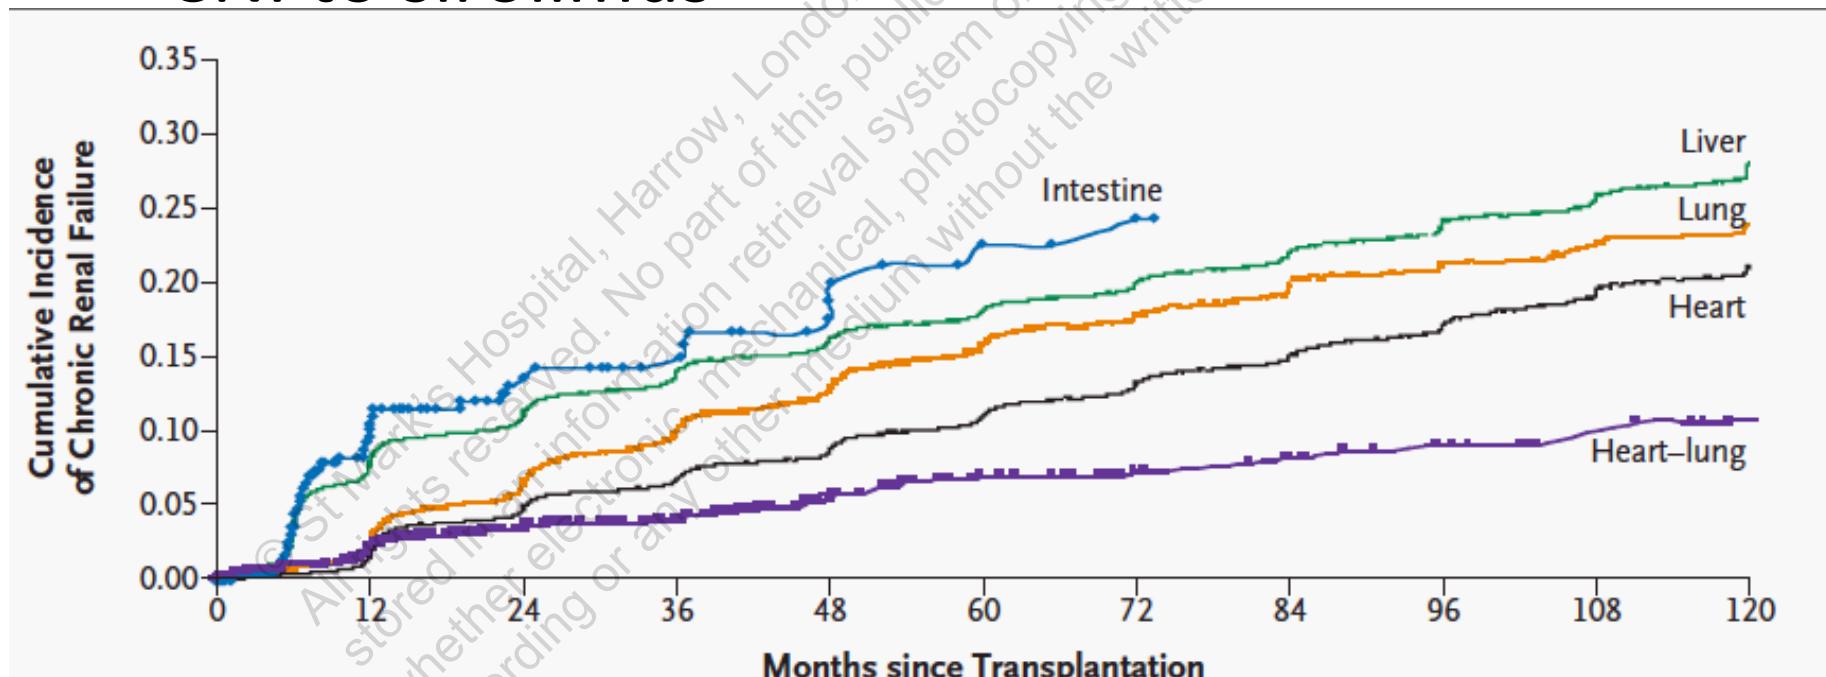

# (EBV-driven) PTLD

- 10%
- Treatment:
  - Reduce IS
  - Rituximab

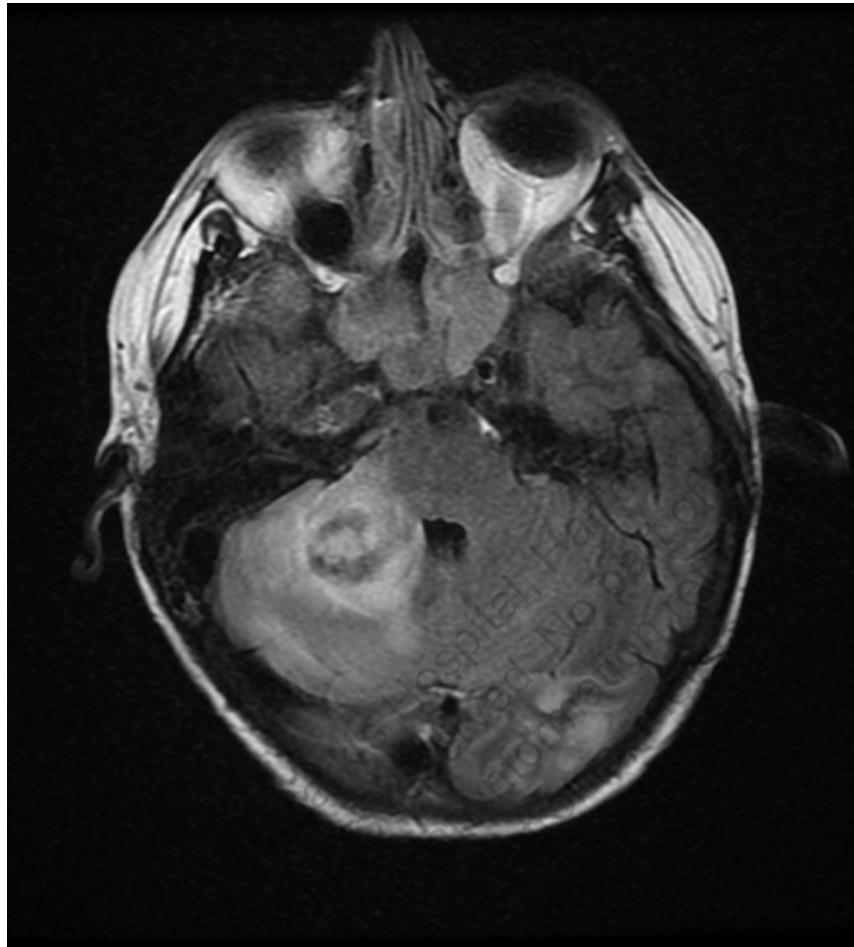

## Renal Dysfunction post ITx

- More common than any other SOT
- Strategies to improve – inclusion of colon, restoring continuity, hyperhydration, switch CNI to sirolimus

# Infections

- Increasing problem with ESBL, VRE, CRE
- Candida and aspergillus most common fungal infections
- Presence of microbiologists and infectious diseases teams at MDT crucial

**RESPIRATORY MICROARRAY (BAL) (Order 43777084)**

## Results

Haemophilus influenzae	Not detected	-
Aspergillus species	<b>Detected (A)</b>	-
Aspergillus 28S CT	26	-

## *Cytomegalovirus (CMV)*

- Most common viral infection
- Overall rate has fallen with matching
- GCV-resistant cases problematic

# Nutritional outcomes

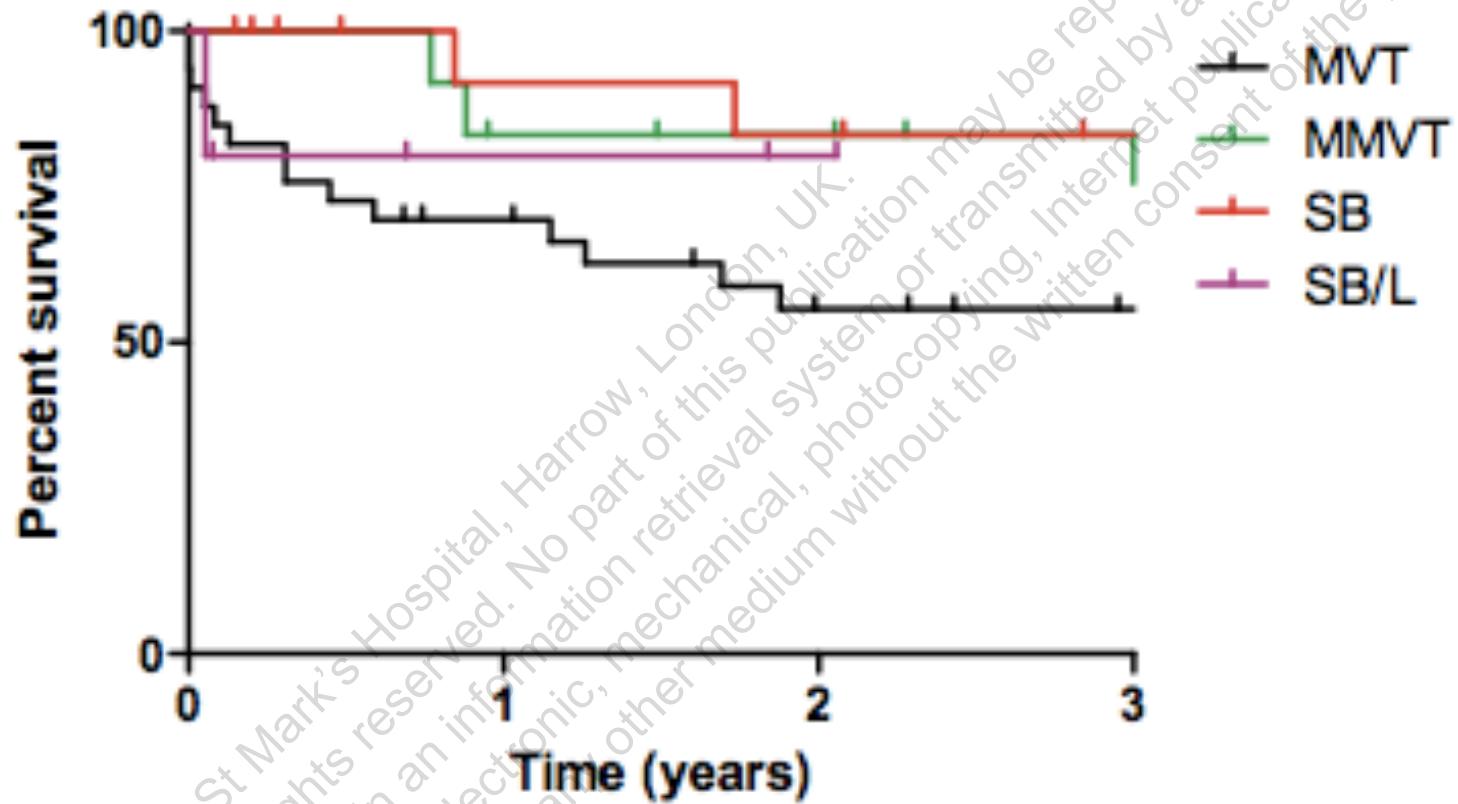

## Handgrip Strength

Pre-Tx (n=38): Mean HGS 77% of expected value

Post Tx at median of 9.3 months (38): Mean HGS 73%

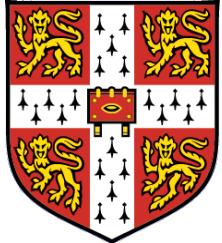

Post Tx at 21 months (20): Mean HGS 84%

Patient **three-year survival, including super urgent patients**,  
following first intestinal transplant, by ITR group, for patients  
transplanted between 1 January 2006 and 31 March 2016 at Cambridge  
transplant unit

# *Intestinal Transplant in 2017*

- Outcomes for Intestine-only grafts remain better than liver containing grafts
  - Esp important in IF patients (**watch the liver!**)
- Indications are expanding but other options should still be explored first
- Timely referral is key (but can be difficult!)
- Developing strategies for managing complications
- We are happy to discuss any case
